SUMMARY

Applied AI engineer completing an M.S. in Computer Science (AI/ML) in December 2026. Builds production data pipelines and monitoring on Google Cloud, and computer-vision systems — a three-class image authenticity classifier and an evaluation harness that ran unattended for days on an 8GB edge device. Brings three years of enterprise SaaS delivery at Yardi, owning implementation for roughly 20 clients, and four years of humanitarian infrastructure program management at the UN. Moves between customer discovery and hands-on build in the same week.

TECHNICAL SKILLS

- **Languages:** Python, TypeScript, JavaScript, SQL, Java
- **Backend & Data:** FastAPI, PostgreSQL, SQLAlchemy/Alembic, BigQuery, REST APIs, OpenAPI 3.1, data modeling and normalization
- **Cloud & Infrastructure:** Google Cloud (Cloud Run, Cloud Scheduler, BigQuery, Cloud Logging & Monitoring), AWS (VPC, EKS), Terraform, Kubernetes, Docker, Linux/Bash, CI/CD
- **AI & ML:** PyTorch, computer vision, LLM evaluation design, prompt engineering, output monitoring and failure triage, local and quantized inference (Ollama), Gemini API, agentic development workflows
- **Delivery & Practice:** Spec-driven development, Git/GitHub, unit and integration testing, code review, customer discovery and solution design, enterprise implementation and system conversion, Agile delivery

PROFESSIONAL EXPERIENCE

Forward Deployed / Backend Engineer Intern | Xylo AI Studios

SF Bay Area, CA (Remote) | June 2026 – Present

- Own the ingestion and data-extraction service layer of a communications platform for financial-advisory firms — pipelines that ingest email, calendar, CRM and meeting-transcript data and link records across sources.
- Designed and shipped a coverage-monitoring pipeline that derives expected meeting counts from calendar data, turning invisible capture failures into a concrete signal (“nine of twelve meetings captured”) instead of an untraceable alert; deployed as a scheduled Cloud Run job over BigQuery views, with log-based metrics and alert policies.
- Built a per-customer, per-platform classifier separating healthy, degraded and stalled capture, with a connected-platform gate that suppresses false alarms for services a customer never linked.
- The diagnostic surfaced a live production outage during development — one customer’s transcripts had stopped landing two weeks earlier with nothing flagging it — and I shipped the view and classifier corrections that closed it.
- Ship Python/FastAPI REST endpoints and reversible PostgreSQL migrations (SQLAlchemy/Alembic), each delivered with unit and integration tests and independent code review.
- Contributed to a platform re-architecture clarifying how customer accounts, credentials and integration sources relate, reducing ambiguity in how new integrations are onboarded.

Software Engineer Intern | FiPet

San Francisco Bay Area, CA | Feb 2026 – June 2026

- Built and deployed cross-functional production features in TypeScript against evolving product requirements, running end-to-end validation across environments before every pull request.

Technical Account Manager | Yardi Systems Inc.

Toronto, Canada | Jul 2022 – Aug 2025

- Owned end-to-end delivery for a book of roughly 20 enterprise real estate clients — discovery, solution design, configuration, data conversion and go-live — on Yardi’s SaaS platform.
- Led cross-functional implementations, aligning customer stakeholders, core engineering and support teams against defined timelines and scope, and holding accountability for delivery.
- Translated ambiguous business requirements and bug reports into explicit technical specifications developers could act on, then validated delivered functionality against real customer workflows.
- Drove adoption of complex SaaS modules through technical enablement — diagnosing application and data-layer errors in live customer environments, and training enterprise users to self-sufficiency.

Field Associate / Project Officer | United Nations (UNHCR & UNDP)

Erbil & Sulaimaniyah, Iraq | Jun 2014 – Jan 2019

- Led up to three concurrent humanitarian cash-for-work infrastructure projects, managing on-the-ground execution for over 3,000 workers under shifting security and funding constraints.

- Built and deployed a centralized cloud-based operational reporting system that replaced siloed spreadsheet tracking across multiple international agency offices, aligning stakeholders on a single source of truth.

New Account Administrator | Aviso Wealth

Toronto, Canada | Dec 2020 – Jul 2022

- Maintained account indexing pipelines and audited electronic fund transfer pathways in a regulated environment, coordinating data requests with MFDA and IIROC compliance teams.

Co-Founder / Brand Manager | LimeWare (Amazon E-Commerce)

Toronto, Canada | Mar 2021 – May 2022

- Ran a consumer brand end to end — supplier sourcing, inventory logistics, pricing optimization, SEO and paid-search auditing through Amazon Seller Central.

RESEARCH & TECHNICAL PROJECTS

ProofShape — Defect-Aware 3D Inspection — *CS595 Capstone, three-person team*

- Authored and froze a versioned OpenAPI 3.1 contract decoupling the capture and reconstruction services, with per-endpoint fixtures and schema-validation tests — including a structural regression test enforcing the system's core safety invariant, that unobserved regions can never contribute to a Pass verdict.
- Collected and validated the golden-capture benchmark dataset: five multi-view sets (~140 phone photos) of rigid parts on a ChArUco board across lighting conditions, with caliper-derived CAD ground truth.
- Established the team's engineering baseline — enforced branch protection, required CI (lint and type checks), one-PR-per-story review workflow — and reviewed teammates' pull requests, catching data-integrity and cross-platform defects before merge.

Relational Reasoning in Vision-Language Models Across a Compute Spectrum — *CS587 individual research; preprint in preparation*

- Designed and executed a pre-registered evaluation of vision-language spatial reasoning from cloud API down to an 8GB NVIDIA Jetson edge device — 2,000-item balanced evaluation set, paired collection, hypotheses and analysis plan frozen in version control before data collection.
- Built the evaluation harness and monitoring for unattended multi-day collection, debugging the device over SSH: kernel out-of-memory diagnosis from system logs, isolating GPU memory failures to specific inputs, and clean resume after interruption. The run survived two unplanned power losses with no data loss.

TruPhoto — Three-Class Image Authenticity Classification — *preprint in preparation*

- Built a three-class classifier separating real, traditionally forged and AI-generated images, combining frozen MobileNetV2 semantic features with a frequency-domain path (FFT radial power spectrum and block-DCT statistics); 75.70% test accuracy across 30,123 images from 36 sources, CPU-only.
- A cross-source sanity check surfaced three dataset-handling bugs across five iterations, each of which had been inflating accuracy; documented an evidence-based decision against fine-tuning derived from per-source accuracy spread.

AWS EKS Cluster Security — *CS581 graduate course project, three-person team*

- Designed a VPC and provisioned an AWS EKS cluster with eksctl and Terraform, including security groups, network ACLs and Kubernetes network policies.

Provisional patent application

- USPTO provisional application 64/018,423 — "System and Method for Multi-Signal Physical Scene Geometry Verification for Image Authenticity Detection," filed March 27, 2026. Sole inventor.

EDUCATION

M.S. Computer Science (AI/ML Concentration) | San Francisco Bay University

San Francisco Bay Area, CA | Expected December 2026 | Cumulative GPA 3.63

- Coursework: Fundamentals of Artificial Intelligence, Algorithms & Structured Programming, Object-Oriented Design in Python, Data Modeling & Implementation, Cloud Security, Individual ML Research Project (Multimodal Computer Vision).

Master of Business Administration | University Canada West

Vancouver, Canada | Strategic Management & Marketing

B.B.A., Minor in Economics | American University of Iraq, Sulaimani

Sulaimani, Iraq
